

BA-QC Written Test – Case Study

Name : Boy Valentyas Indra G

Date : 22 September 2026

Question 1 – Case Study: New Cash Control System - Web Application Development

There is a requirement from the bank to develop Transaction Maintenance System. This is an application to maintain daily transaction data from various bank channel. The outcome of this application will be a report to be consumed by internal bank team and Local/Indonesia Regulator.

This application will be able to retrieve transaction data from several data source system. Every morning, the application will need to get data of previous day to be accumulated in report format. IT User will need to make sure the process is run successfully, as for Business User will use the data for reporting purpose (specific format may defined). Master Customer information is retrieved from bank's internal Datawarehouse.

Based on above illustration, create the following:

1. Requirements Gathering Questions & Answers

Before conduct interviews with Business User to understand their needs and expectations from the Transaction Maintenance System, please write down questions will be used by you to understand the functional, non-functional requirements*, and all necessary information for you to formulate a comprehensive "Functional Specification Document". After that, try to answer the questions assuming you are the user.

**Non-functional requirement shall be defined based on your understanding as an IT/Admin User to monitor the system that you designed.*

2. Functional Specification Document

Formulate comprehensive "Functional Specification Document (FSD)" based on list of questions and answer you've created. At minimum, the FSD must contain:

- a. Summary of Business Needs
- b. Business Requirements
- c. Business/Operation Process Flow (Current & Future)
- d. System Feature, UI Design, Field Definition, and Validation

3. Test Scenario/Cases

Create necessary positive and negative test scenario/cases.

Evaluation Criteria:

Candidates will be evaluated based on their ability to create effective requirements gathering questions, analyze business requirements, think criticality, design effective application, develop comprehensive documentations, and identify necessary test scenario to ensure the implemented applications will run with zero or very minimum bugs.

Question 2 – Translate this System Request into English:

Unit 'Anti Pencucian Uang' memiliki kewajiban untuk melakukan pengecekan secara berkala terhadap 'daftar teroris/penjahat yang diketahui' untuk memenuhi kewajiban jika ada permintaan dari regulator dan/atau permintaan insidental dari kantor utama. Pengecekan ini bertujuan untuk memastikan bahwa tidak ada teroris/penjahat di basis data nasabah bank kami. Tanpa adanya sistem yang dapat melakukan ini secara otomatis, kami butuh melakukan upaya yang lebih banyak untuk menyelesaikan proses pengecekan ini. Di lain pihak, bila ada permintaan dari regulator mengenai hal ini, ada deadline yang cukup ketat untuk menyediakan data hasil pengecekan tersebut.

Khususnya untuk pengecekan daftar teroris (daftar Al Qaeda), berkas XML yang dapat diunduh mengandung banyak halaman yang berisi nama teroris dan alias mereka yang harus kami cek. Dengan kemampuan yang terbatas, proses ekstraksi data akan menjadi proses yang memakan waktu sangat banyak.

Dengan alasan-alasan di atas, pengembangan sistem untuk melakukan Pengecekan Teroris menjadi salah satu proyek prioritas yang kami ajukan untuk meningkatkan efektivitas proses pengecekan tersebut.

Important Notes:

- Please answer all in English.
- For 2nd questions - You don't need to translate it word-for-word. You can translate freely as long as the request's purpose is reflected.
- Utilization of Google/online Translator, Chat GPT, AI Tools is prohibited. We request you to answer all questions by your own capability.

Question 3 – Please conduct personality test in below link and send the result link together with the written test answer.

<https://www.16personalities.com/free-personality-test>

Question 1 – Case Study: New Cash Control System - Web Application Development

1. Requirements Gathering Questions & Answers

> Functional Requirements

A. Data Source & Integration

Q1. What are all the source systems (channels) from which transaction data must be retrieved?

A : Core Banking System (CBS), Automated Teller Machine (ATM), Electronic Data Capture (EDC), Internet Banking, Mobile Banking, Real-Time Gross Settlement (RTGS), SKNBI (Sistem Kliring Nasional Bank Indonesia), Card Management System and some additional channels in the future. That's why the interface design must be scalable and extensible.

Q2. What kind of format and method for each source system to deliver the data?

A : Files like CSV will be using SFTP, Bulk-Messages will use Message Broker/Middleware, some transaction data like RTGS will be using API.

Q3. What time is the data expected to be ready/available from each source, and what is the cut-off time for the data?

A : Data and Files is expected to be ready at 22:00-01:00 on the same day. Cut-off for the 'previous day' should be at 02:00 local time in the next morning.

Q4. Where is the master data should be retrieved from? And how often is it refreshed?

A : From the bank's internal data warehouse (DWH), via batch scheduler job every night

Q5. Is historical / back-dated data correction expected?

A : Yes, source systems occasionally resend a 'corrected' data file within the same day. So, the system must support a re-processing (overwrite) mechanism without making duplicated records. Also if there's some kind of problem while processing data and it is expected to do retry.

B. Data Processing & Scheduling

Q1. What time daily accumulation job should start and expected to be completed?

A : The batch job must start automatically at 02:30 and complete before 06:00 so the data will be ready to be used by Business Users before working day starts at 07.00

Q2. What happens if a source file is late, missing, incomplete or fails validation?

A: The batch job should proceed with the available sources, flag the missing/failed source to the job status log, send alert/email report to IT Users. The report should indicate which channel's data is incomplete

Q3. Does the process need to run only once a day, or should be there an option for manual trigger?

A : Both. the job should have an automation schedule to run once a day, and the job should be able to be triggered manually so IT Admin can do data fix on-demand if issues found.

Q4. Should transaction be categorized/ grouped in the report?

A : Yes, the transaction data should be categorized by channel used, type (debit/credit), currency, branch, and can be sorted by date & time, amount, sender and recipient. So the data can be easily analyzed, and used by internal management and for regulatory reporting.

C. Reporting & Output

Q1. Who are the consumers of the report and do they need different formats?

A : Internal Bank Team (Finance/Operation/Compliance) usually need Excel/CSV format for data analyzing. Local Regulator (OJK/BI) reporting need a specific layout report matching the regulator's predefined template, exportable to CSV / TXT and PDF for record keeping

Q2. Is there a specific regulatory report format/template already defined?

A : Yes, the regulator format already have a predefined template such as fixed-width CSV. The exact field layout will be attached once confirmed with Compliance.

Q3. Do users need to view/search individual transaction on screen or only download the aggregate report?

A : Both. A search bar or filters should be available for the Users to do quick-look up for an individual transactions (should be shown and sorted by date, account, channel, amount range). And a downloadable daily report.

Q4 : Should the system retain historical daily report for a defined period, and can users generate a report for the past date?

A : Report must be retained online for at least 24 months (by regulation) and users should be able to regenerate/re-download the reports.

D. User Roles, Access and Reconciliation

Q1. What user roles are needed and what can each role do?

A : Minimum 3.

- Admin (for IT Admin Users) : to configure interface, monitor/re-run jobs, read logs, manage other users.
- Business Users : to view/search transaction, generate report
- Business Approver : to check, review and approve/release the report before it is submitted to the regulators.

Q2. Is reconciliation/balancing check required between source system totals and the accumulated report totals?

A : Yes. Record count and amount total per source per day must be compared automatically and any mismatch above the tolerance must block the report release until it reviewed.

Q3. Are there any data masking or confidentiality requirements for customer information to be shown in the report/UI?

A : Yes. Any PII should be masked on-screen for any un-authorized roles as per Indonesia's PDP Law. Full detail should only be visible to authorized Compliance/Investigation roles with an audit trail of access.

> Non-Functional Requirements Questions and Answers

E. Performance, Availability & Scalability

Q1. What is the expected daily transaction volume, and what is the expected growth for the next 2-3 years ahead?

A : Approx. 3-5 million transactions/day currently, expected to grow 20% per year. The batch and database design should comfortably scale to at least handle 15 million/day.

Q2. What is the required application/system availability (SLA : Service Level Agreement) and acceptable downtime window?

A : 99.5% availability during business hours (07:00-19:00 WIB). Planned maintenance should only be outside of these hours with advanced notice to users.

Q3. What is the maximum acceptable processing time (SLA) for the nightly accumulation batch, and for on-screen report generation?

A : Nightly batch : Maximum of 3.5 hours for end-to-end process (02:00-06:30). On screen ad-hoc report/export : Maximum of 2 minutes for a single day single-channel query amount of data.

F. Monitoring, Alerting & Logging

Q1. How should IT Admin be notified if the batch job fails, runs late or a source file is missing?

A : Automated email, SMS, slack/office messenger alert to the IT Admin distribution list. A dashboard status indicator (Red/Orange/Green) per job steps. Automated escalation if not acknowledged within 30 minutes.

Q2. What level of audit trail/logging is required?

A : Full audit log of

- user logins (who : which username, when, where : ip addresses)
- What the users do (which menu accessed, what report generated, what data downloaded)
- Any configuration changes

And the log should be retained for at least 5 years per bank record-keeping policy

Q3. Is dashboard required for IT Admin? What kind of status should be shown?

A : Yes. A single dashboard showing per-source consumed status, record counts received vs. expected, batch steps time stamps and status, any errors for current and past business dates.

G. Security, Backup & Data Retention

Q1. What are the security requirements for data in transit and at rest, and for authentication?

A : TLS (Transport Layer Security) for all file transfers/APIs, encryption at the database, SSO/AD integration with RBAC and mandatory MFA for action that needs approvals.

Q2. What are the backup and disaster-recovery (DR) requirements?

A : RPO (Recovery Point Objective) of 15 minutes and RTO (Recovery Time Objective) of 4 hours, with nightly full backup and DR site replication, in line with the bank's Business Continuity Plan (BCP) policy.

Q3. How long transaction and report data be retained, and is there a data-archival requirement?

A : Online retention for 24 months, with archival to cold storage for a further 8 years to meet BI/OJK record-keeping requirements, retrievable within 2 business day on request.

2. Functional Specification Document (FSD)

Document : FSD-TMS-001 | System : Transactional Management System | Version : 1.0 | Status : Draft for Review

2.1 Summary of Business Needs

The Bank requires a Transaction Maintenance System (TMS) to centrally collect, validate, and accumulate daily transaction data from multiple bank channels (Core Banking, ATM, EDC, Internet Banking, Mobile Banking, RTGS, SKNBI), enriched with Master Customer Data from the bank's Data Warehouse.

Every morning, the system must automatically retrieve and consolidate the previous business day's transactions into a standard reporting format, so that :

- IT Users can confirm the daily batch has completed successfully and quickly identify/resolve failures.
- Business Users can rely on complete, accurate and timely ready data to produce report for internal use.
- Compliance can extract and submit reports to the Local Regulator (OJK/BI) with predefined format, on time and full auditability.

This addresses the current pain points of manual, channel-by-channel data collection that are slow, easy to get error and difficult to reconcile and audit.

2.2 Business Requirements

No.	Business Requirement	Priority
BR-01	The system should automatically retrieve previous business day transaction data from all defined source channels every morning before 06:00	High
BR-02	The system should retrieve and refresh master data information from the bank's data warehouse to enrich transaction records	High
BR-03	The system should validate, reconcile and accumulate transaction data into a predefined format	High
BR-04	The system should send notification alert to IT and provide monitoring dashboard of the job status	High
BR-05	The system should allow Business Users to view, search, and filter transaction data on the screen with masked PII fields	Medium
BR-06	The system should be able to generate reports in format required by Internal Compliance teams (in Excel/CSV) and by the Local Regulator (Fixed Layout CSV/PDF)	High
BR-07	The system should have approval workflow for validation	High

	before regulatory report is released/submitted	
BR-08	The system should allow authorized IT Admin to manually re-run process of a specific business date (backdate)	Medium
BR-09	The system should maintain full audit trail of data access, report generation, and approval actions	High
BR-10	The system should retain report and transaction data online for a minimum of 24 months and archiving mechanism	Medium

2.3 Business / Operation Flow

2.3.1 Current State Process Flow - Manual (BAU)

Each channel's transaction is extracted and collected manually, then consolidated in spreadsheets. No automation, time-consuming, great human error risk, with no audit trail.

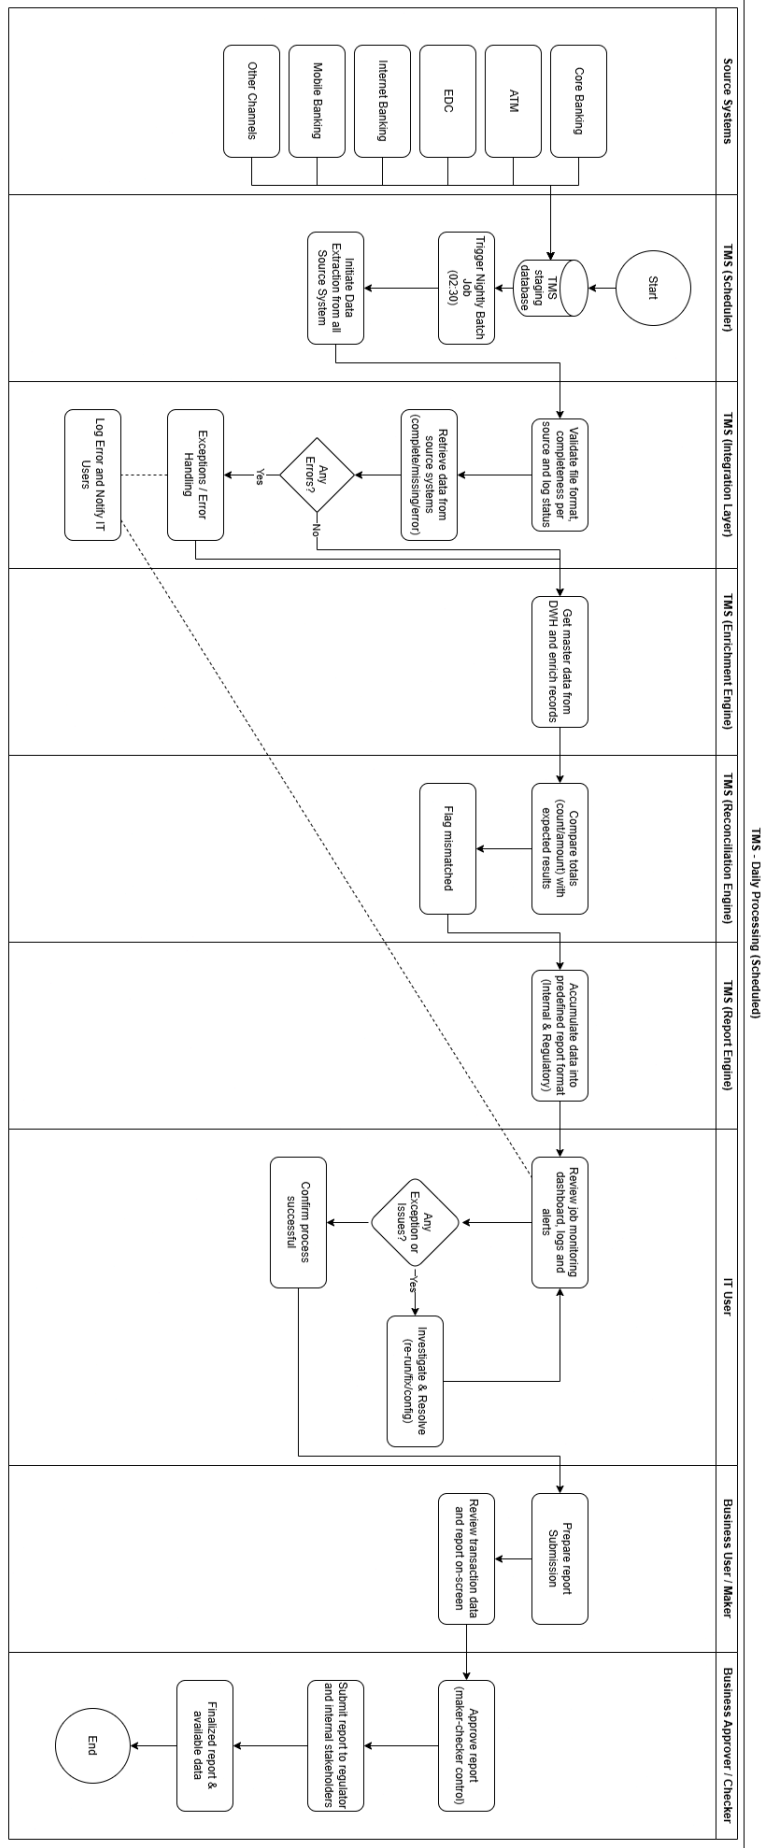

Step	Actor	Activity
1	Source System Owner	Manually export transaction file from each channel system at the end of the day
2	Business User	Manually download each file from a shared drives/email and copy into working folder
3	Business User	Manually consolidate all channel files into a master Excel workbook, applying formulas and lookups
4	Business User	Manually look up customer detail from a separate DWH data extract to enrich the transaction data
5	Business User	Manually checks totals against source system reports (often incomplete due to time pressure)
6	Business User / Supervisor	Format the consolidated data into the internal report and the regulator template. Then supervisor reviews via email
7	Business User	Submits the report to the Regulator and internal stakeholders via email/portal upload

2.3.2 Expected State Process Flow - With TMS

With TMS, data ingestion, enrichment, reconciliation and reporting are automated end-to-end, with human involvement limited to monitoring, review and approval.

Step	Actor	Activity
1	Source Systems	Each channel automatically deliver its daily transaction file/API feed to TMS by agreed cut-off time
2	TMS (Scheduler)	Automatically trigger the nightly batch job at 02:30 to ingest all available source file/feeds
3	TMS (Integration Layer)	Validate file format/completeness per source status (completed/missing/error)
4	TMS (Enrichment Engine)	Retrieves Master Data from DWH and mapping/enriches each transaction records
5	TMS (Reconciliation Engine)	Compares control totals (count/amount) per source against expected values, flag mismatches
6	TMS (Report Engine)	Accumulate validated data into the predefined report format (internal and regulatory layouts)
7	IT User	Review the job monitoring dashboard each morning to confirm successful completion, resolve any flagged exceptions / occurring issues
8	Business Users (Maker)	Review/search transaction data on screen and generates the draft report for the day
9	Business Approver (Checker)	Reviews and approves/releases the report (maker-checker control) before submission
10	TMS	Deliver the approved report to internal users and prepares the regulator-format extract for submission

2.4 System Features, UI Design, Field Definition & Validation

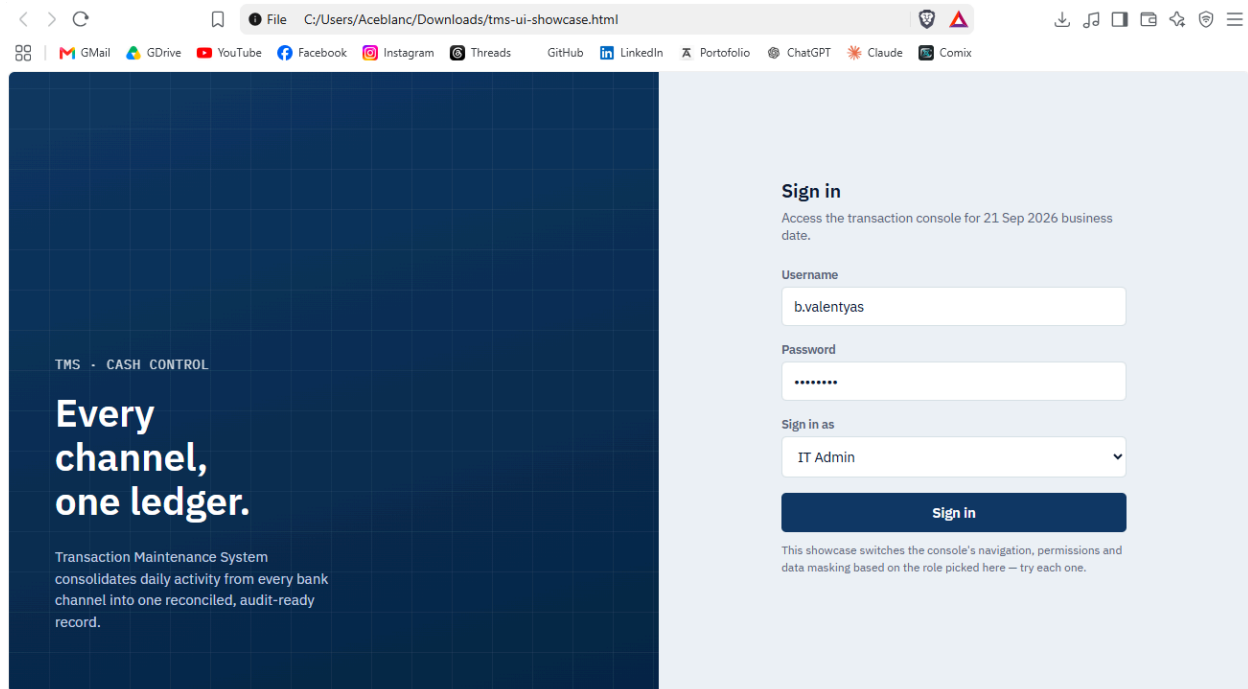

2.4.1 Feature List

Feature ID	Feature Name	Description
F-01	Interface Monitoring Dashboard	Display per-source ingestion status, record counts, and batch job timestamps for IT Admin
F-02	Job Scheduler & Manual Re-run	Automatic nightly trigger with manual re-run capability for selected business date
F-03	Transaction Search & Inquiry	Search/filter transactions by date, channel, account, amount, and transaction type
F-04	Report Generation & Export	Generate reports for internal use (Excel/CSV) and for Regulatory (Fixed Layout CSV/PDF)
F-05	Maker-Checker Approval	Workflow to submit, review, and approve/reject a report prior to release
F-06	Reconciliation Control	Automated control-total comparison between source and accumulated data, with exception handling
F-07	User & Role Management	Manage users, roles (IT Admin/Maker/Checker) and access rights
F-08	Audit Trail Viewer	View logs of logins, data access, generation and approval actions

2.4.2 UI Design - Screen Overview

Screen 1 : Login

Fields : Username, Password, [Login] button. Support SSO/AD login and MFA prompt for Checker/Admin roles. On failure, display generic error message without indicating whether the username or password was incorrect

Screen 2 : Job Monitoring Dashboard (IT Admin landing page)

Layouts : a summary status bar (Overall status : Green / Orange / Red) at top, table of source systems showing source name, expected time, received time, status, record count, amount total, log

Job Monitoring Dashboard

Nightly ingestion status for business date 21 Sep 2026 1 channel need attention

6 Sources configured

5 Received on time

05:42 Batch completion (SLA 06:00)

3,214,880 Transactions processed

Source	Expected	Received	Status	Records	Amount (IDR)	Action
Core Banking System	22:30	22:41	Received	1,240,110	482,110,300,000	View log
ATM / EDC Switch	23:00	23:12	Received	812,440	96,442,190,000	View log
Internet Banking	23:30	23:35	Received	540,220	210,884,500,000	View log
Mobile Banking	23:30	23:44	Received	601,330	188,220,900,000	View log
RTGS	00:30	—	Missing	—	—	Re-run
SKNBI / BI-FAST	01:00	01:04	Received	20,780	64,010,200,000	View log

Screen 3 : Transaction Inquiry (Business User landing page)

Filter panel : Business Date (range), Channel (multi-selection), Transaction Type, Account (Masked for non authorized roles), Amount (range), Currency.
Result is shown with masked column

The screenshot shows a web application interface for 'TMS'. The top navigation bar includes the text 'TMS Business date · 21 Sep 2026' and a user profile 'b.valentyas' with a 'Sign out' button. A left sidebar contains a menu with 'Monitor', 'Job Monitoring', 'Operate', 'Transaction Inquiry' (highlighted), 'Report & Approval', 'Administer', and 'User Management'. The main content area is titled 'Transaction Inquiry' with the subtitle 'Search and filter processed transactions for the selected business date'. Below this is a filter panel with four fields: 'Channel' (dropdown set to 'All channels'), 'Type' (dropdown set to 'All types'), 'Min amount' (input field with '0'), and 'Max amount' (input field with 'No limit'). There are 'Search' and 'Reset' buttons. A note states 'Account numbers masked for your role.' Below the filter panel is a table with the following data:

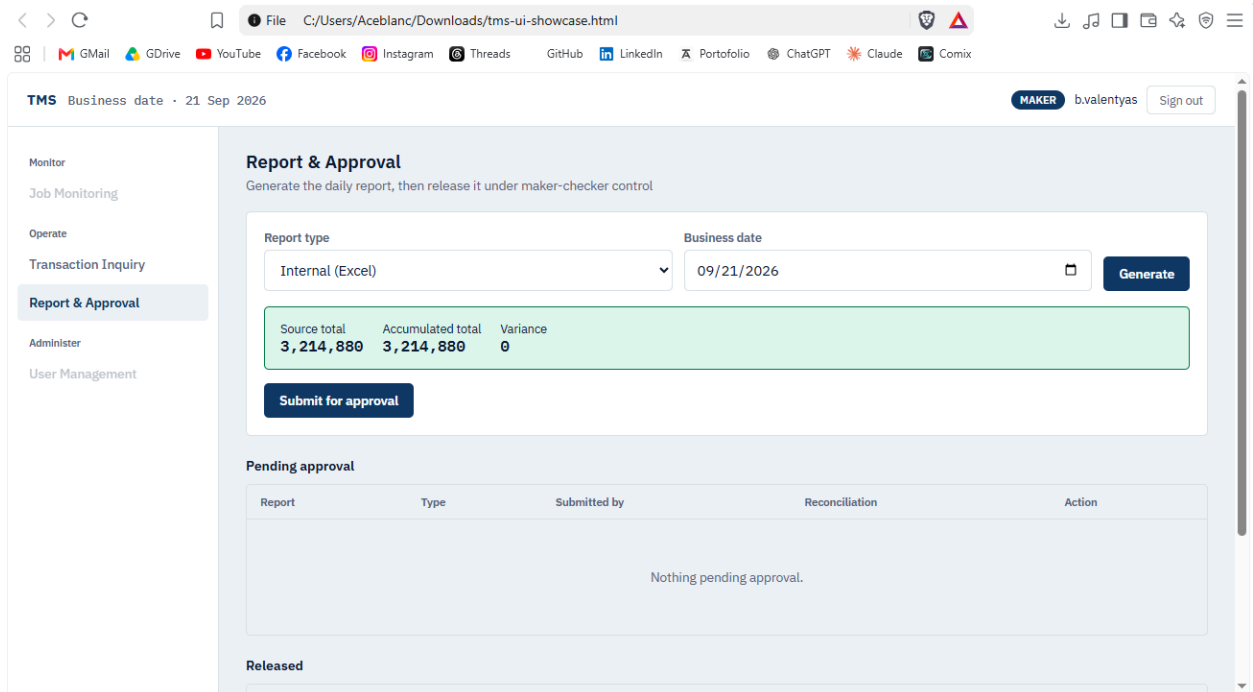

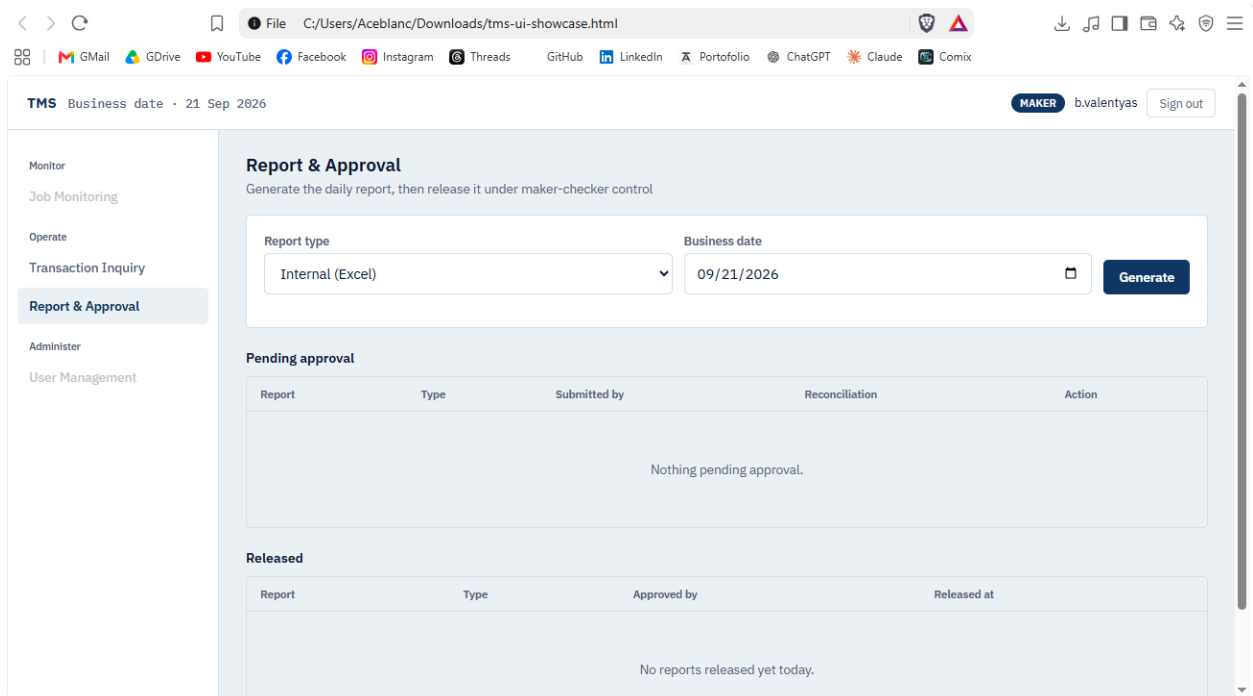

Time	Channel	Account	Type	Amount (IDR)	Status
22:41:03	Core Banking	1020***57	Debit	4,500,000	• Posted
22:41:09	Core Banking	1020***20	Credit	12,000,000	• Posted
23:12:44	ATM/EDC	5510***44	Debit	1,500,000	• Posted
23:14:02	Internet Banking	2209***65	Credit	87,250,000	• Posted
23:35:51	Internet Banking	2200***37	Reversal	2,000,000	• Reviewed
23:44:18	Mobile Banking	3391***84	Debit	620,000	• Posted
00:02:09	RTGS	7712***44	Credit	450,000,000	• Posted

Screen 4 : Report Generation & Approval

Maker selects business date and report type (internal/regulatory), click [generate] and shows reconciliation summary (matched/mismatched totals) before [submit for approval]

Checker sees a queue of pending reports with [approve]/[reject] action

2.4.3 Field Definition & Validation

Transaction Inquiry - Filter Fields

Field	Type/Format	Mandatory	Validation Rules
Business Date (From/To)	Date (DD-MM-YYYY)	Yes	'From' date must be <= 'To' date. 'To' date cannot exceed the system's last successfully processed date. Max range is 90 days
Channel	Multi-select list	No	Values restricted to the configured active channel list. Default will be 'All'
Transaction Type	Dropdown	No	Values restricted to predefined list
Account	Numeric, max. 20 digits	No	Numeric characters only. Partial match allowed for authorized roles
Amount Rage	Numeric, 2 decimals	No	Min must be <= Max. Both must be >= 0. Max value bounded by currency precision rules
Currency	Dropdown (ISO 4217)	No	Must be a valid, active currency

			code configured in the system
--	--	--	-------------------------------

Report Generation - Fields

Field	Type/Format	Mandatory	Validation Rules
Business Date	Date (DD-MM-YYYY)	Yes	Must be a date which batch processing has completed successfully. Future dates is rejected
Report Type	Dropdown (Internal / Regulatory)	Yes	Regulator type requires the reconciliation status to be 'Matched' before [Generate] is enabled
Output Format	Dropdown (Excel/CSV/PDF)	Yes	PDF is mandatory and forced if the selected report type is Regulatory
Approval Comment	Free text. Max 500 chars	Conditional	Mandatory when the Checker action is Reject. Optional for Approve

3. Test Scenarios / Test Cases

3.1 Batch Ingestion & Reconciliation

TC ID	Type	Scenario	Test Steps	Expected Result
TC-B-01	Positive	All source files arrive on time and pass validation	1. Make sure all channel files are placed by cut-off 2. Trigger/await the 02:30 batch job	Job completes before 06:00. Dashboard status shown all 'Green', control Totals amount matched
TC-B-02	Positive	Business date is re-processed after a correction file is re-sent	1. Trigger manual re-run jobs for backdate 2. Provide corrected	Previous day's records for that source are overwritten (not duplicated). Reconciliation

			files/data source file	Totals update accordingly
TC-B-03	Negative	One or more source file is missing at cut-off time	1. Withhold one or more channel source files 2. Allow the batch job to run	Job proceeds with any available source. Missing sources are flagged on dashboards. Sent email alerts to IT Team, with clear report indicating the missing/incomplete channel's data
TC-B-04	Negative	A source file is corrupted or fails format validation	1. Submit a file with an invalid delimiter/structure/file extension 2. Run the batch job	File / data is rejected with a specific error message and logged. Exclude the accumulation of the bad files
TC-B-05	Negative	Total amount mismatch between source and accumulated beyond the threshold	1. Inject a discrepancy between the source count/amount and processed data 2. Run reconciliation	System will flag a reconciliation exception and block the report from being marked 'Ready for Approval' until resolved

3.2 Transaction Inquiry

TC ID	Type	Scenario	Test Steps	Expected Result
TC-I-01	Positive	Search transactions with a valid date range and channel type	1. Login as Business User 2. Set valid From/To date and Channel filter	Matching transactions are shown, correctly filtered with PII are masked as per role

			3. Click Search	authorization
TC-I-02	Positive	Export search results to Excel	1. Perform a valid search 2. Click Export	An Excel / CSV file downloads containing exactly the filtered result
TC-I-03	Negative	'From' date entered later than 'To' date	1. Enter From = 25-09-2026, To = 20-09-2026 2. Click Search	System shown a validation error message
TC-I-04	Negative	Non-numeric characters entered in Account Number field	1. Enter 'ABC123' in Account Number field 2. Click Search	Field-level validation error message is shown. Search / query is not submitted, to the backend
TC-I-05	Negative	Unauthorized role attempts to view unmasked detail of customer data	1. Login as a role without unmask data privilege 2. Attempt to view full account/customer details	Data remain masked. Unauthorized attempts are logged in audit trail

3.3 Report Generation & Maker-Checker Approval

TC ID	Type	Scenario	Test Steps	Expected Result
TC-R-01	Positive	Generate a regulator report for a fully reconciled date	1. Login as Maker 2. Select date with 'Matched' reconciliation status 3. Select report type = Regulatory 4. Click Generate	Report is generated in correct fixed layout and PDF Format, and moves to 'Pending Approval' status

TC-R-02	Positive	Checker approves a pending report	1. Login as Checker 2. Open the pending report 3. Click Approve	Report status changes to 'Released'. Report becomes available to internal users. Action is recorded in audit trails with Checker ID and a timestamp
TC-R-03	Positive	Checker rejects a report with comment	1. Login as Checker 2. Open the pending report 3. Click Reject and enter a comment	Report status changes to 'Rejected'. The maker is notified. Comment is stored and visible to Maker
TC-R-04	Negative	Attempt to generate a Regulatory report for a date with unresolved reconciliation exceptions	1. Select a date flagged 'Mismatched' 2. Select report type = Regulatory 3. Click Generate	Button Generate is disabled or returns a blocking validation message. Report cannot be created until reconciliation is resolved
TC-R-05	Negative	Checker attempts to reject without entering a mandatory comment	1. Login as Checker 2. Click Reject without enter a comment 3. Click Submit	System block submission with a validation message requiring a comment
TC-R-06	Negative	Make attempts to approve their own submitted report	1. Login as the same user who acted as Maker 2. Attempt to access the Approved action for their own report	System denies the action/does not display Approve option for the report's own Maker

3.4 System Monitoring, Access & Non-Functional

TC ID	Type	Scenario	Test Steps	Expected Result
TC-S-01	Positive	IT Admin manually triggers re-run a batch for a specific business date	1. Login as IT Admin 2. Select a business date 3. Click Run	Batch re-execute for that business date only. Dashboard status updated. Timestamp and Action are logged in audit trail
TC-S-02	Positive	Batch complete within the agreed time	1. Trigger nightly batch job under normal load / data volume 2. Measure start / end time	Batch start at 02:30 and ends before 06:00
TC-S-03	Negative	Invalid login credentials	1. Enter an incorrect password 3 times	Generic 'invalid username or password' message shown. No hint which is wrong. Account is locked after 3x fail attempts
TC-S-04	Negative	Session timeout / inactivity	1. Login 2. Idle beyond configured timeout 3. Attempt an action (refresh/click button or menus)	User is automatically logged out and redirected to the login screen. No residual sensitive data remains visible
TC-S-05	Negative	Batch job runs longer than the agreed SLA cut-off time	1. Simulate a late-arriving source file 2. Observe the batch completion time	System raise an SLA breach alert to IT Team even if the job is completed. Showing the delay occurred and logs it

Question 2 – Translate this System Request into English

'Anti-Money Laundering' Unit is required to periodically check the "latest terrorist / criminal list" to fulfill regulatory and/or incidental requests from the main office. These checks aim to ensure that there are no terrorist / criminals in our bank's customer database. Without a system that can perform this automatically, we would need to expend more effort to complete this check process. Conversely, if a regulatory request is made, there is a tight deadline for providing the check results.

In particular, for the terrorist list check (Al Qaeda list), the downloadable XML file contains many pages containing the names of terrorists and their aliases that we must check. With limited capabilities, the data extraction process would be extremely time-consuming.

For the reasons mentioned above, developing a system for conducting Terrorist Checks is one of our priority projects proposed to improve the effectiveness of this check process.

Question 3 – Please conduct personality test in below link and send the result link together with the written test answer.
